Projects

Assessment of C-reactive protein / serum albumin ratio in relation to acute presentation and early outcome of patients with Acute Coronary Syndrome

April, 2021 - February, 2022

Aim of the research: To assess the association of C-reactive protein to albumin ratio (CAR) with in hospital short-term major adverse cardiac events (MACEs) in acute coronary syndrome (ACS) patients.

Conclusion: The CAR was independently correlated with in-hospital short- term MACEs and can be used for risk stratification in patients with ACS. Its cutoff value can be helpful guide in ascertain the need of immediate PCI compared with those can kept under-conventional conservative medical treatment.
